Project 2

countryCities.java

For this program, the goal is to read through a txt file that contains information about a country and will be able to sort the countries and its respective cities. The program will be able to display the country, the country's largest city and population, and the number of small, medium, and large cities in the country. When the program finishes displaying the information about the country and its cities, the program will prompt the user if they want to know more information about the country and cities which first, asks the user for the country, then asks for the size of cities, and then it displays the cities included for the given size and its respective country. The program is also able to recognize whether the input is valid or not and will display an error message if it encounters an error.

Known Bugs:

-no known bugs.
